

Please delete claims 1 and 8; amend claims 2, 3, 5, 7 and 9; and add claims 10-13, as follows:

2. (Once Amended) An eyeglass combination comprising:

a primary frame including a first bridge and two sides each having a stud; and
an auxiliary frame for disposing in front of the primary frame, the auxiliary frame
including a second bridge and two sides each having an extension extended rearward
toward the primary frame and extended over one of the studs, the extensions each
including a rear end having a first flange extended downward;

[according to claim 1,] wherein

said studs of said primary frame [are made of] each includes a magnetic material;

said first flanges each includes a magnet for engaging with the magnetic material
of one stud [said studs of magnetic material] and for securing said auxiliary frame to said
 primary frame; and

when the auxiliary frame is coupled to the primary frame.

the extensions can be supported by the studs to prevent the auxiliary frame
from moving downward relative to the primary frame; and

the flanges are located behind the studs to further secure the auxiliary frame
to the primary frame, and to reduce the likelihood of the auxiliary frame from being
disengaged from the primary frame if the auxiliary frame is being pulled forward
relative to the primary frame.

2. (Once Amended) An eyeglass combination according to claim 1 wherein the magnetic
 material in each stud is a magnet.

6. (Once Amended) An eyeglass combination according to claim [1] 2 wherein said
 second bridge includes an arm extended over said first bridge of said primary frame, said
 arm includes a rear end having a second flange extended downward for engaging with said
 first bridge and for securing said auxiliary frame to said primary frame.

7. (Once Amended) An eyeglass combination comprising:

a primary frame including a first bridge, said first bridge including a first magnet;
 and]

an auxiliary frame for disposing in front of said primary frame, said auxiliary frame including a second bridge having an arm extended rearward toward said primary frame and extended over said first bridge, said arm including a rear end having a flange extended downward for engaging with said first bridge and for securing said auxiliary frame to said primary frame, said flange including a second magnet for engaging with said first magnet and for securing said auxiliary frame to said primary frame;

wherein when the auxiliary frame is coupled to the primary frame,

the arm can be supported by the first bridge to prevent the auxiliary frame from moving downward relative to the primary frame; and

the flange is located behind the first bridge to further secure the auxiliary frame to the primary frame, and to reduce the likelihood of the auxiliary frame from being disengaged from the primary frame if the auxiliary frame is being pulled forward relative to the primary frame.

8. (Once Amended) An eyeglass combination according to claim [8] ⁶2, wherein [said studs and] said first bridge of said primary frame [are] is made of magnetic material, said second flange [flanges each] includes a magnet for engaging with [said studs and] said first bridge of magnetic material and for securing said auxiliary frame to said primary frame.

4. (New) An eyeglass combination according to claim ²2 wherein said second bridge includes an arm extended over said first bridge of said primary frame, said arm includes a rear end having a second flange extended downward for engaging with said first bridge and for securing said auxiliary frame to said primary frame.

5. (New) An eyeglass combination according to claim ⁴10 wherein said first bridge of said primary frame includes a magnet, said second flange includes a magnet for engaging with the magnet of the first bridge and for securing the auxiliary frame to the primary frame.

12. (New) An eyeglass device for coupling to a primary frame, the primary frame including a first bridge and two sides, each side of the primary frame having a stud, each stud including a magnetic material, the eyeglass device comprising:

an auxiliary frame for disposing in front of the primary frame, the auxiliary frame including a second bridge and two sides each having an extension extended rearward

toward the primary frame and extended over one of the studs, the extensions each including a rear end having a first flange extended downward; and

wherein

said first flanges each includes a magnet for engaging with the magnetic material in each stud and for securing said auxiliary frame to said primary frame; and

when the auxiliary frame is coupled to the primary frame,

the extensions can be supported by the studs to prevent the auxiliary frame from moving downward relative to the primary frame; and

the flanges are located behind the studs to further secure the auxiliary frame to the primary frame, and to reduce the likelihood of the auxiliary frame from being disengaged from the primary frame if the auxiliary frame is being pulled forward relative to the primary frame.

13. (New) An eyeglass device for coupling to a primary frame, the primary frame including a first bridge, the first bridge including a magnetic material, the eyeglass device comprising:

an auxiliary frame including a second bridge, the second bridge having an arm extended rearward toward said primary frame and extended over said first bridge, said arm including a rear end having a flange extended downward for engaging with said first bridge and for securing said auxiliary frame to said primary frame, said flange including a magnet for engaging with the magnetic material in the first bridge and for securing said auxiliary frame to said primary frame;

wherein when the auxiliary frame is coupled to the primary frame,

the arm can be supported by the first bridge to prevent the auxiliary frame from moving downward relative to the primary frame; and

the flange is located behind the first bridge to further secure the auxiliary frame to the primary frame, and to reduce the likelihood of the auxiliary frame from being disengaged from the primary frame if the auxiliary frame is being pulled forward relative to the primary frame.
